

Irrigation System Activation/Winterization

Begin your spring startup by turning on the main gate valve and the backflow preventer. Make sure that the clock is on and times are set. Turn on the system manually and check that all heads and nozzles are properly watering the areas they are supposed to. Winterize your system as soon as the temperatures start to drop and we begin receiving enough rainfall. It is important to have the system drained of water and have the back flow preventer turned off and insulated. Do not forget to protect the hose outlets. It is best to turn off the system clock/controller to complete winterization.
